

I'm Mercyline Makuto current engineer in training at the AkiraChix Campus in Karen.

I've been a student at the campus for the last 26 days and have already gained so many skills in the different fields we're being trained on.

Below is a summary on all the subjects I've learnt so far;

UI/UX DESIGN

- ❖ All about putting your ideas to life
- ❖ Drawing of different shapes
- ❖ Applying the principles and elements of design
e.g harmony
- ❖ Practicing with different patterns
- ❖ Focuses on the visual aspect of everything;
including both software and hardware.

UX RESEARCH

UX Research is all about understanding the needs Of customers and satisfying them as per the user requirements.

- ❖ Understanding customer needs
- ❖ Meeting customer requirements
- ❖ Following the HCD process in satisfying user needs
- ❖ Aligning customer needs with company objectives
- ❖ Conducting extensive research before deploying any product

NAVIGATING YOUR JOURNEY

- ❖ This has been the most interesting lesson so far.
- ❖ Focuses on our mental health
- ❖ Aims to teach us more about ourselves
- ❖ Teaches us about self-care and order

Enlightens us about sexual health care

Teaches us how to be confident , boost our self-esteem and presenting in front of a crowd.

FRONT-END WEB DEVELOPMENT

The first class was about how to use Git

Taught us how to create Github accounts and repositories

Has taught us how to code on the terminal

Has also enlightened us on how to create files in the terminal

The class also taught us how to add, commit changes on the terminal and push them to our repositories in the Github.

FRONT-END MOBILE DEVELOPMENT

This mostly focuses on Kotlin which is a programming language used to develop mobile applications.

There are different types of characters in Kotlin such as the Char, Booleans, Arrays etc

There are two types of variables in Kotlin e.g Immutable and mutable variables

Immutable variables are written with the abbreviation var and do not change

Mutable variables start with the abbreviation val and can change

Data and Software Architecture

This class includes Data Science and Analytics, Machine learning and AI.

We've learnt that there's only a specific language a computer understands.

We learnt that computers can use either the 32-bit or 64-bit system for processing and analyzing data.

The 64-bit system can analyse and process data faster than 32-bit system

QUALITY MANAGEMENT

We learnt about the SDLC process which stands for Software Development Life Cycle.

The aim of QA is to make sure the products or services clients and users get are of the best quality.

There are test plans, test cases in QA

We have different test types in QA

We learnt about the different functional and nonfunctional requirements of a login page.

PRODUCT MANAGEMENT

We learnt that the product manager oversees all the operations going on in a company.

There are different personas in different services such as the customer, riders or sellers.

Different personas have different pain points in all businesses.

Product managers have to work with everyone in the company including both designers and developers.

Product managers have to have good social skills, patience and good communication skills to work with a team.

BACK-END DEVELOPMENT

We started about learning the different commands used in the terminal e.g mkdir for making a directory

We started with the Python Programming language for this lesson.

We saw that the Python commands and the HTML commands are quite different

Python is used by most programmers in both backend and frontend development

We also learnt about the different frameworks like Django
